Motivation

Inline Multi-line scan calibration toolbox

Overview

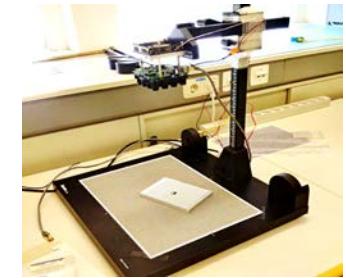

Introduction

Calibration, Rectification

AIT Calibration Toolbox

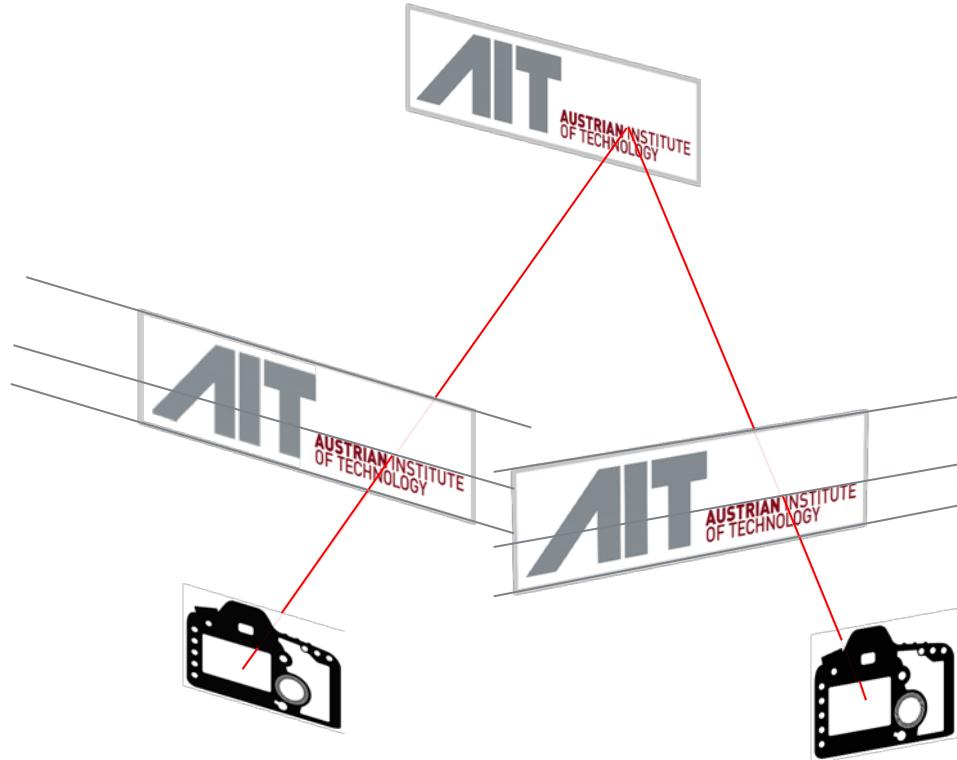

Camera Array

Applications

3D Stereo

Calibration

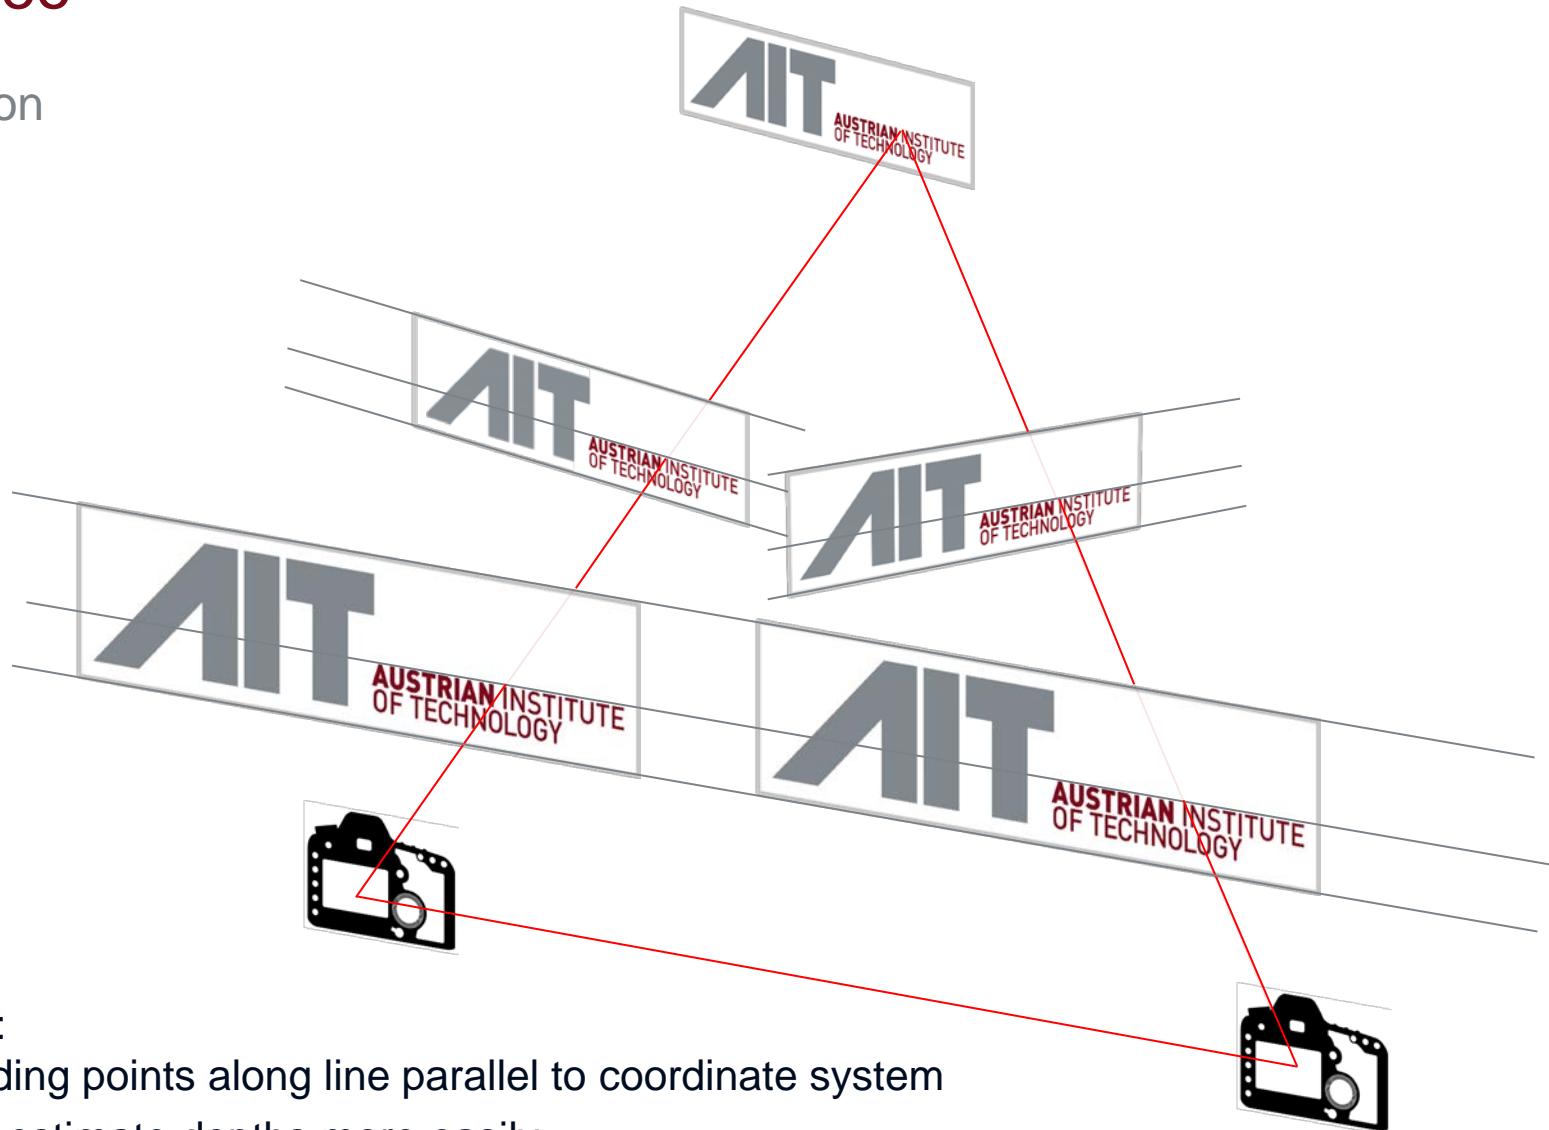

Calibration:

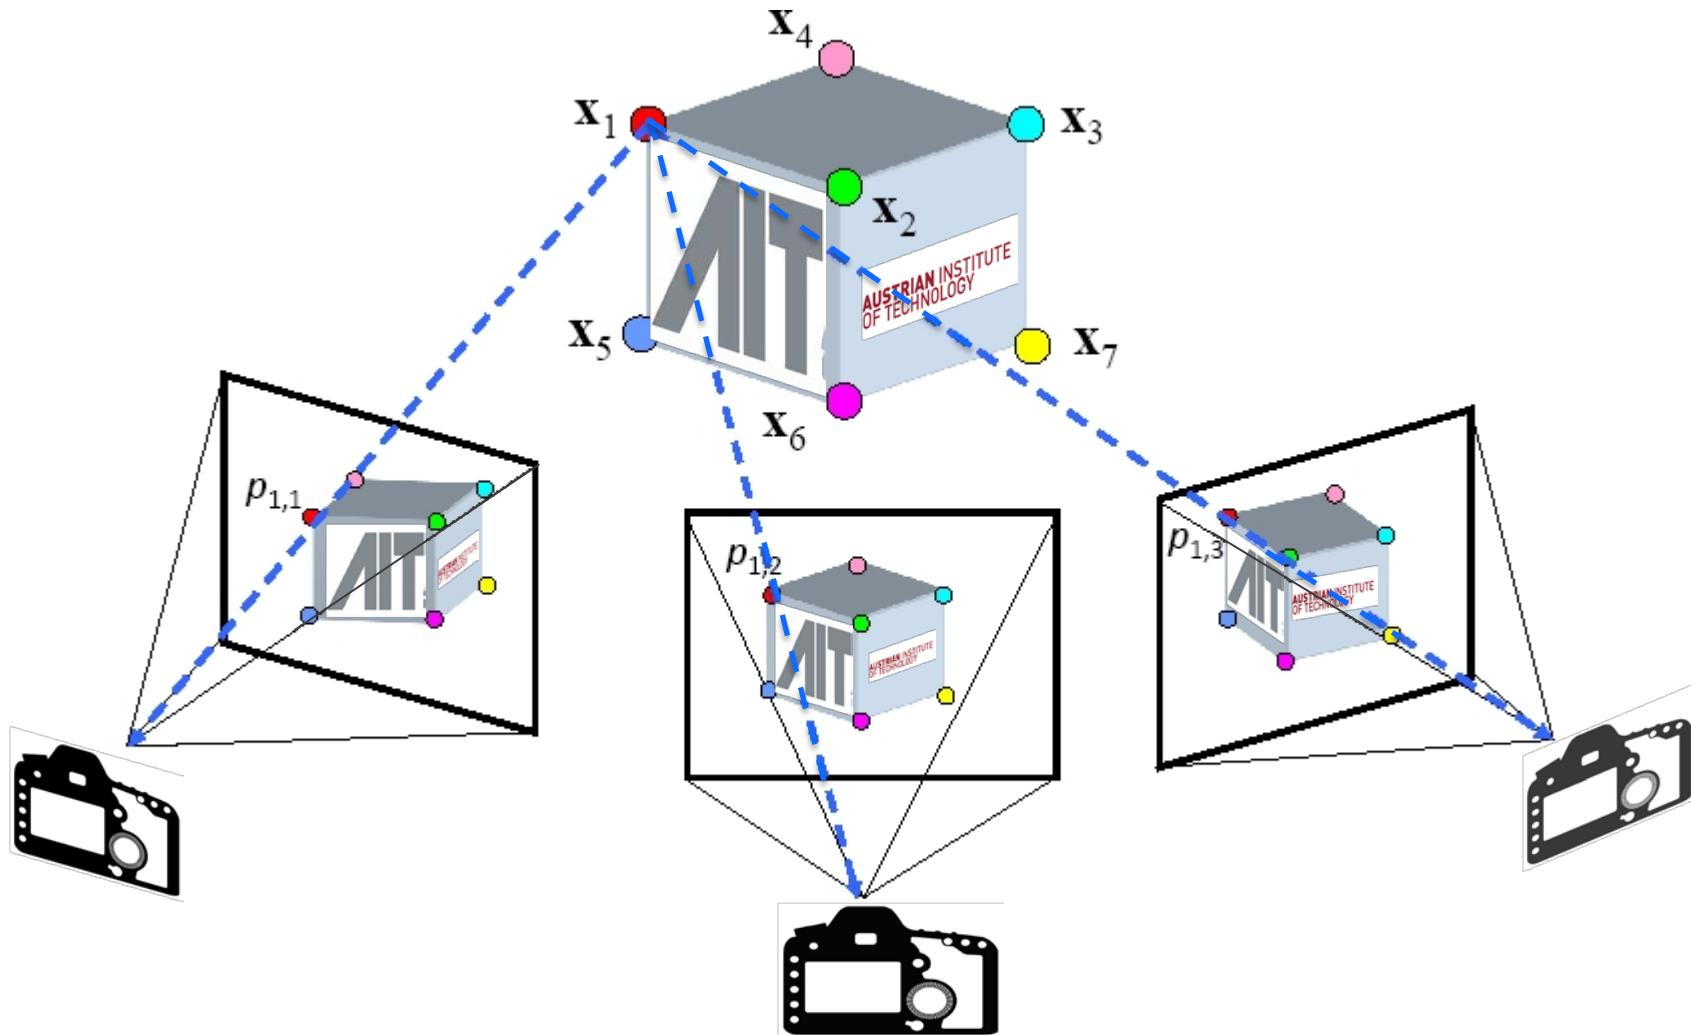

know the **positions, rotations**, focal lengths, distortions of all cameras

3D Stereo

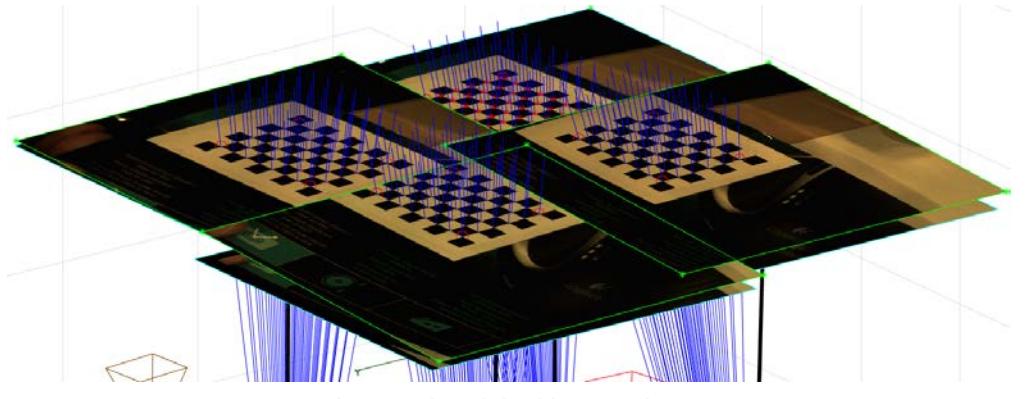

Rectification

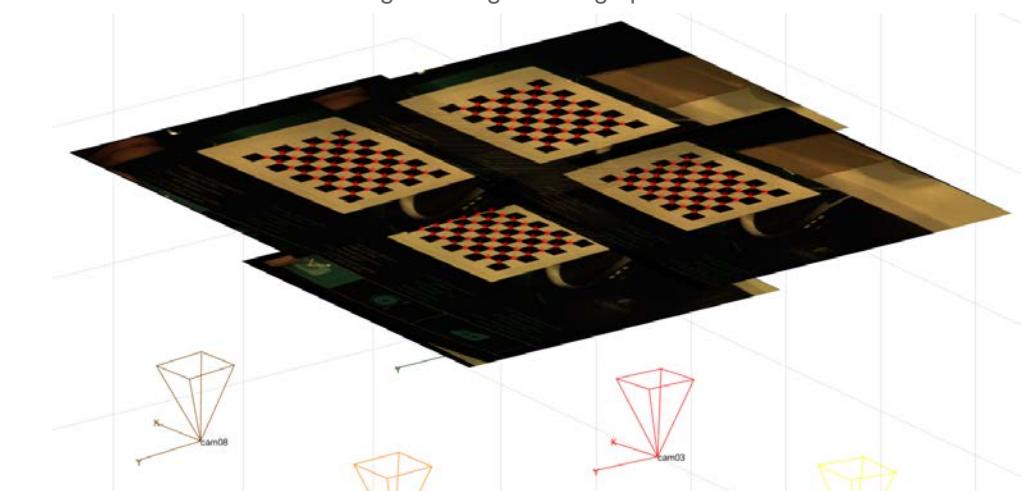

Multiview Stereo for depths estimation

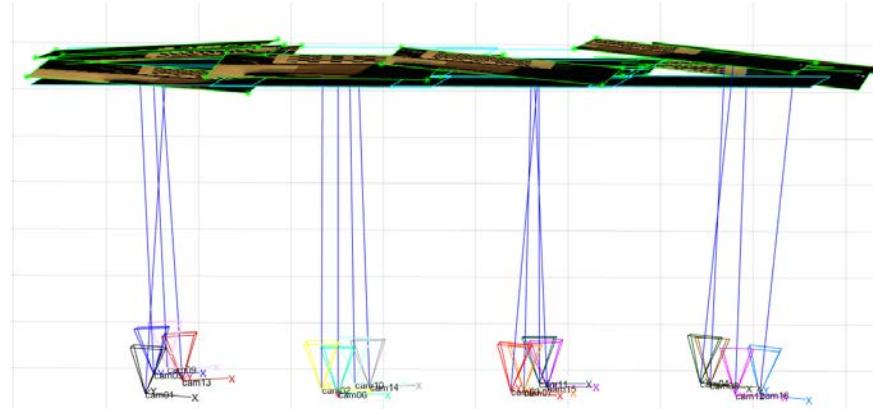

Rectification through reprojection

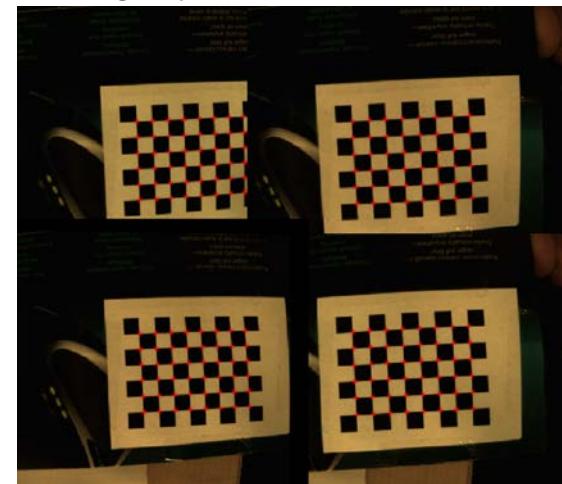

Images in original image planes

Images reprojected to common plane

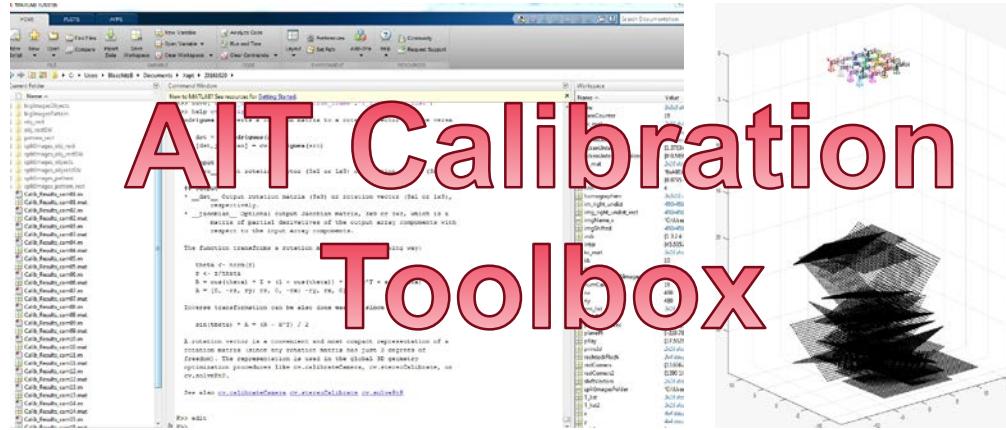

Original planes view from front

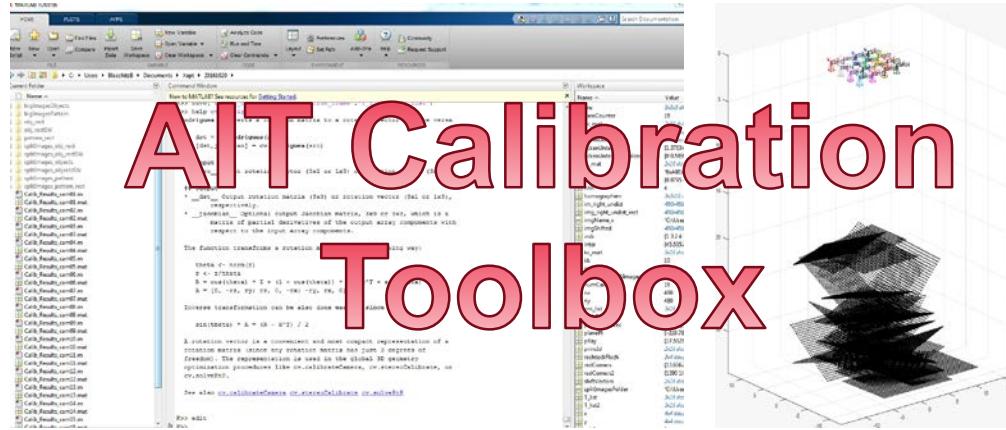

Top view of rectified images

AIT calibration toolbox

- We developed an toolbox that can turn any multi-view camera array into a **multiview stereo camera system**, resp. into a **light field camera**, which is well suited for capturing **depth information**.
- The toolbox allows for determination of all **intrinsic** (*focal lengths, principal points, distortions*) and **extrinsic** (*positions and rotations* of cameras w.r.t. each other and w.r.t. the input checkerboard patterns) camera parameters, which enables us to undistort and rectify the images.

AIT calibration toolbox

- The software has been realized in **Matlab**, images provided through standard interfaces.
- The calibration itself depends on the *Complete Camera Calibration Toolbox for Matlab* by Jean-Yves Bouguet, see http://www.vision.caltech.edu/bouguetj/calib_doc/ and uses some routines of the [OpenCV] Toolbox, <http://code.opencv.org/>

Camera calibration model

- David Claus, Andrew W. Fitzgibbon: *A Rational Function Lens Distortion Model for General Cameras.* CVPR (1) 2005: 213-219

$$x' = x/z$$

$$y' = y/z$$

$$x'' = \frac{x' (1+k_1 r^2 + k_2 r^4 + k_3 r^6)}{1+k_4 r^2 + k_5 r^4 + k_6 r^6} + 2p_1 x' y' + p_2 (r^2 + 2x'^2)$$

$$y'' = \frac{y' (1+k_1 r^2 + k_2 r^4 + k_3 r^6)}{1+k_4 r^2 + k_5 r^4 + k_6 r^6} + p_1 (r^2 + 2y'^2) + 2p_2 x' y'$$

$$\text{where } r^2 = x'^2 + y'^2$$

$$u = f_x * x'' + c_x$$

$$v = f_y * y'' + c_y$$

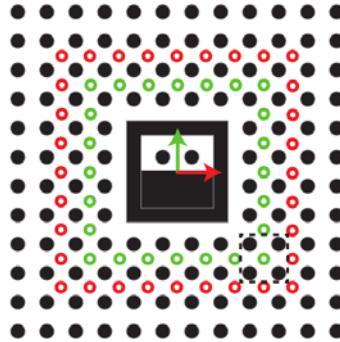

- Intrinsic camera model has 12 degrees of freedom
 - 2 focal lengths (f_x, f_y)
 - 2 principal point coordinates (c_x, c_y)
 - 6 radial distortion parameters ($k_1, k_2, k_3, k_4, k_5, k_6$)
 - 2 tangential distortion coefficients (p_1, p_2)

Details of the implementation

Our contribution

- Use of the improved **calibration target** by ICG of TU Graz

Ferstl, D., Reinbacher, C., Riegler, G., Rüther, M., & Bischof, H. Learning Depth Calibration of Time-of-Flight Cameras.
https://github.com/RobVisLab/camera_calibration

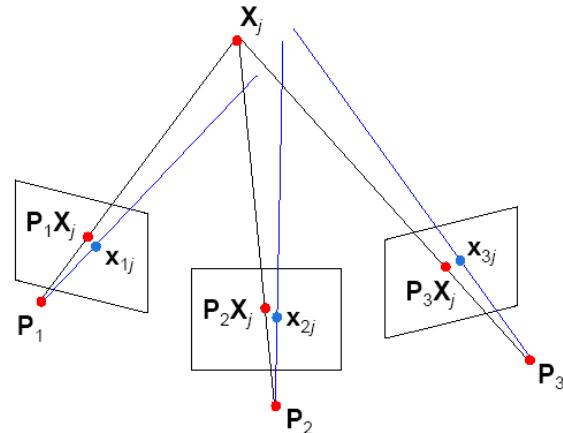

- A true multi view calibration instead of a pairwise stereo calibration, which means **bundle adjustment through optimization**.
Cf. *Bundle adjustment gone public* by Manolis I.A. Lourakis at PRCV 2012, see <http://users.ics.forth.gr/~lourakis/sba/>
- Row-wise resp. column-wise epipolar images rectification, which allows for an exact depth measurement for a multiview image (not only stereo).

Details of the implementation

Bundle Adjustment

- Is a non-linear method for refining extrinsic and intrinsics camera parameters, as well as the structure of the scene
- Means minimizing the reprojection error

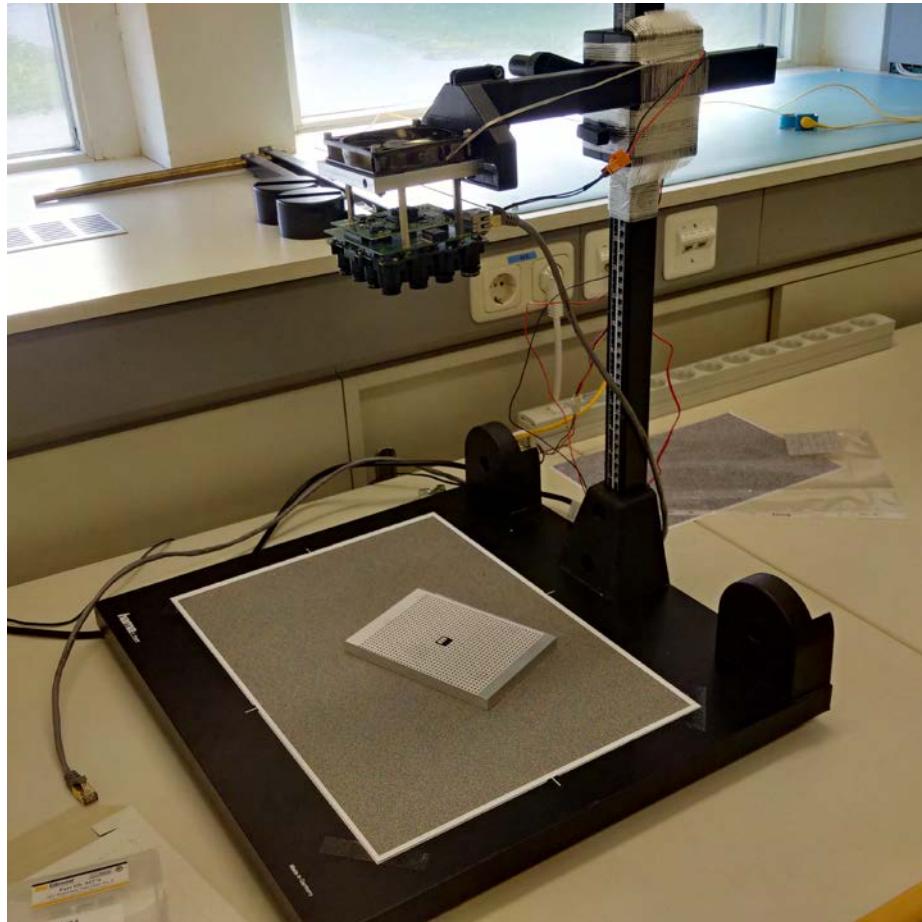

$$\gg E(P, X) = \sum_i \sum_j dist(x_{ij}, P_i X_j)^2$$

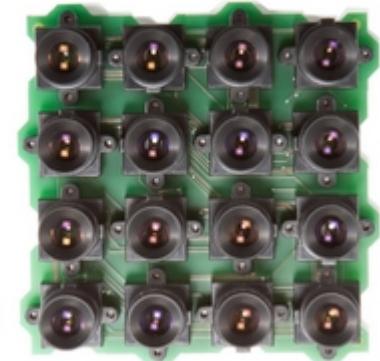

C.f. Fergus, Rob., Computer Vision Spring 2014, <http://cs.nyu.edu/~fergus/teaching/vision/>

Applications of our toolbox

Camera array

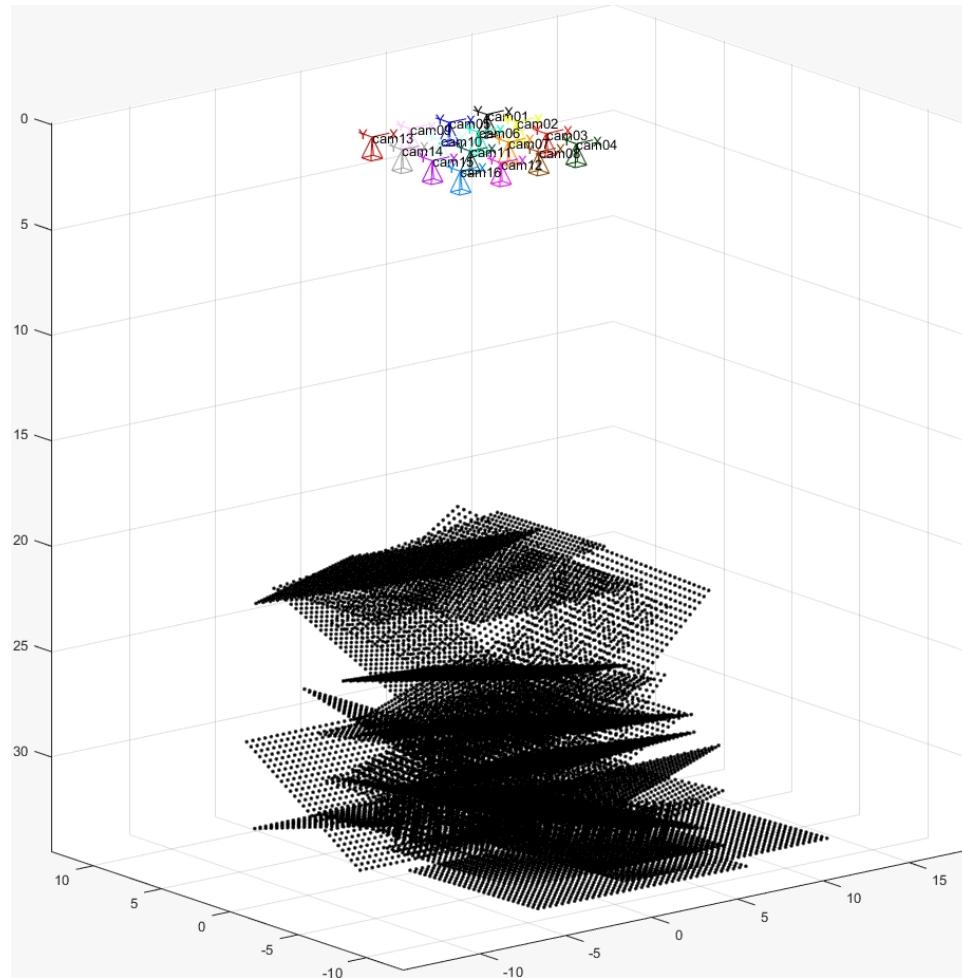

EYE-SECT XA

For all camera-related questions,
please refer to <http://xapt-gmbh.de/>

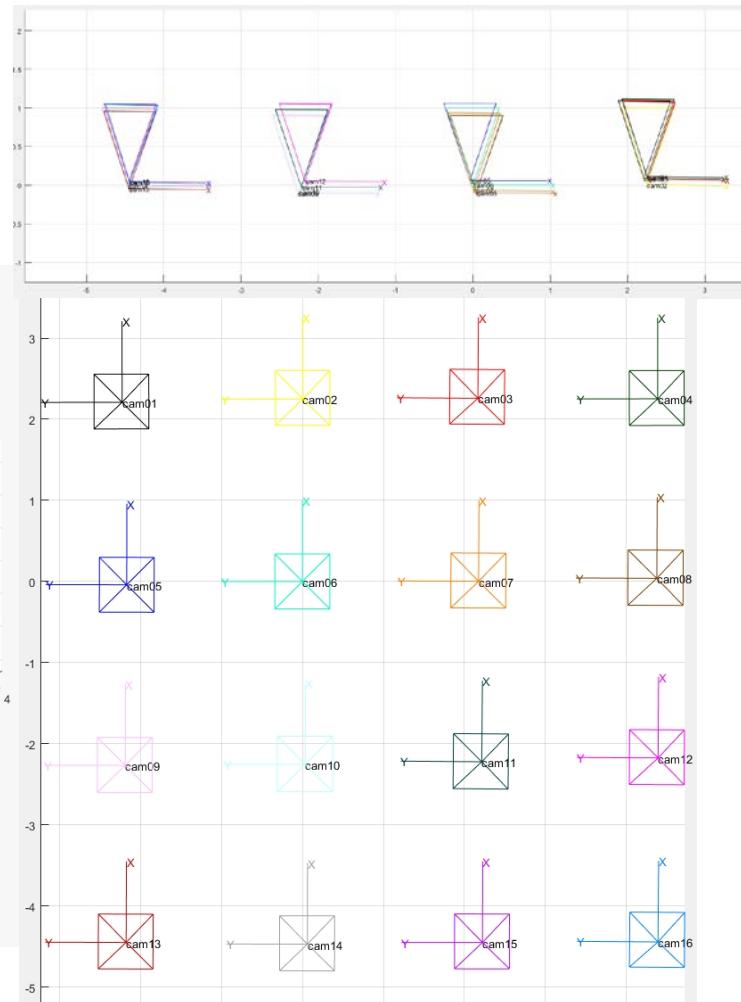

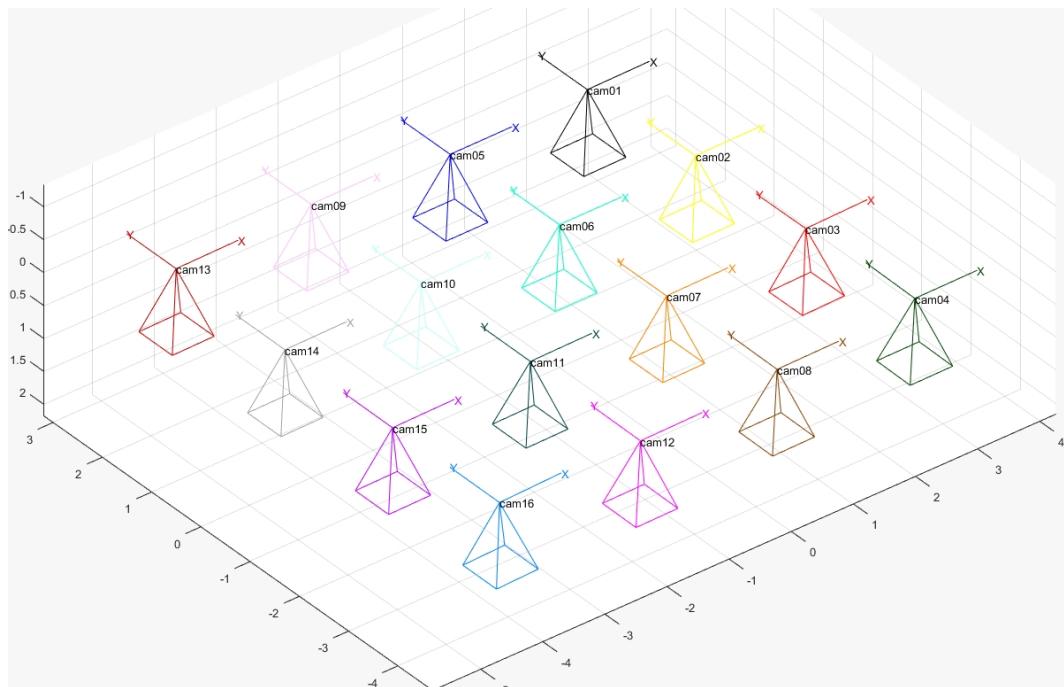

Applications of our toolbox

Camera array with pattern positions

Output of the calibration

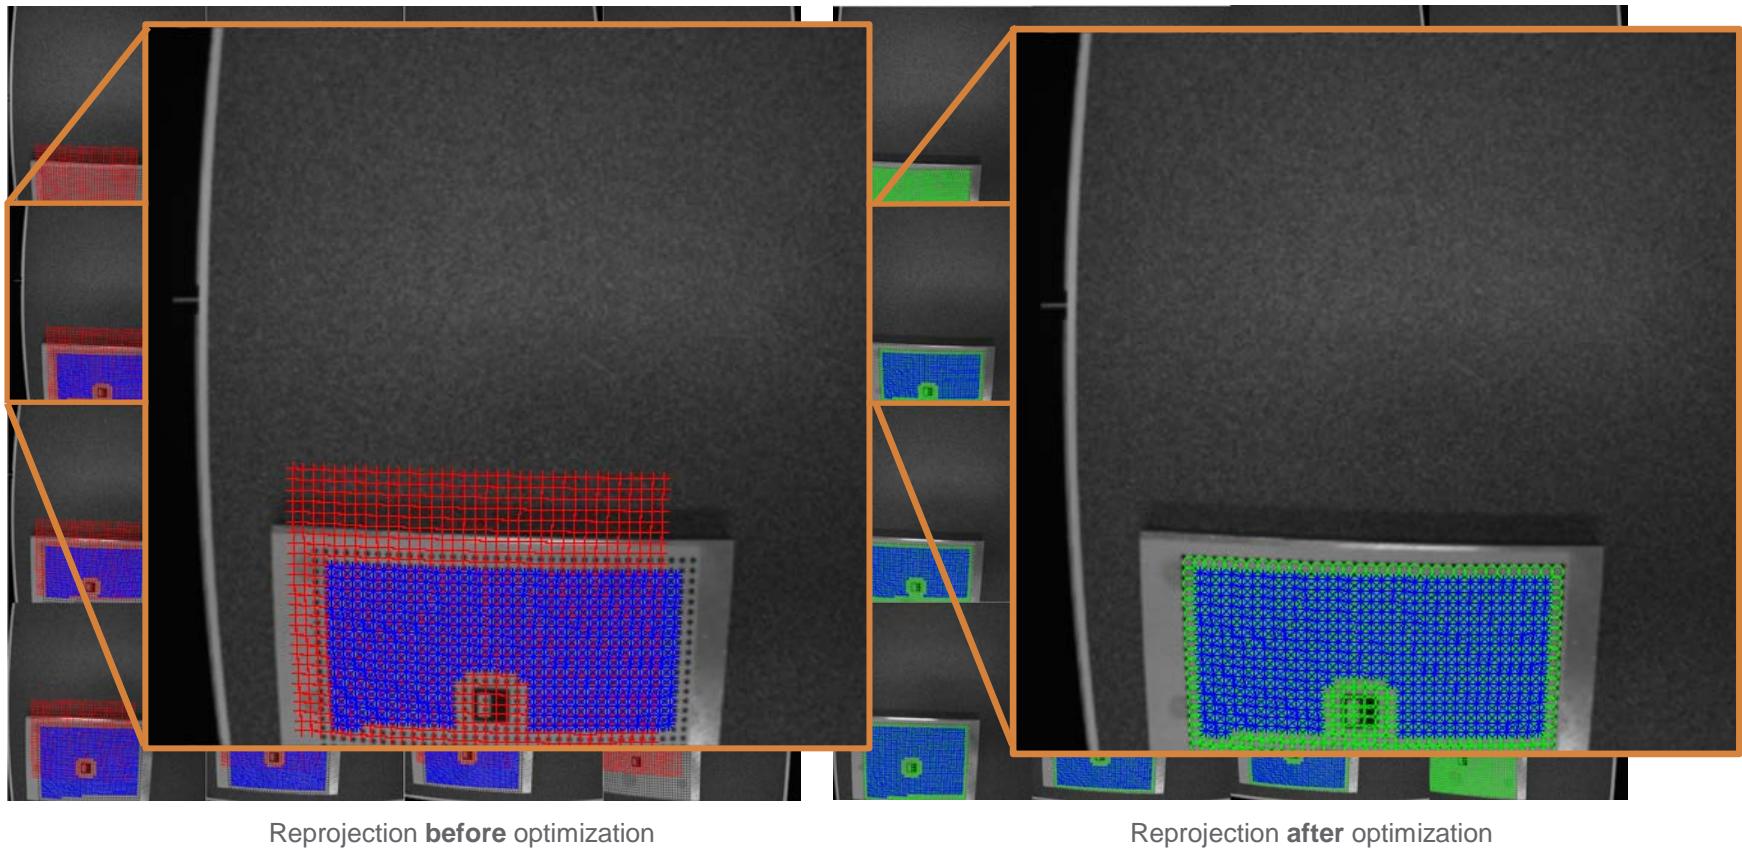

Camera Positions

cam01	cam02	cam03	cam04	cam05	cam06	cam07	cam08	cam09	cam10	cam11	cam12	cam13	cam14	cam15	cam16
22,172	22,363	22,144	22,125	-0,233	0	-0,159	0,149	-22,873	-22,586	-22,415	-22,06	-44,85	-44,824	-44,723	-45,386
22,171	0,235	-21,542	-43,62	21,721	0	-21,778	-43,761	22,022	-0,142	-21,961	-43,964	22,094	-0,003	-22,069	-43,516
0,329	-0,772	-0,104	-0,173	0,141	0	0,009	-0,113	-0,773	-0,286	0,357	1,213	-0,61	0,593	0,99	1,197

Output of the calibration

Reprojection Errors

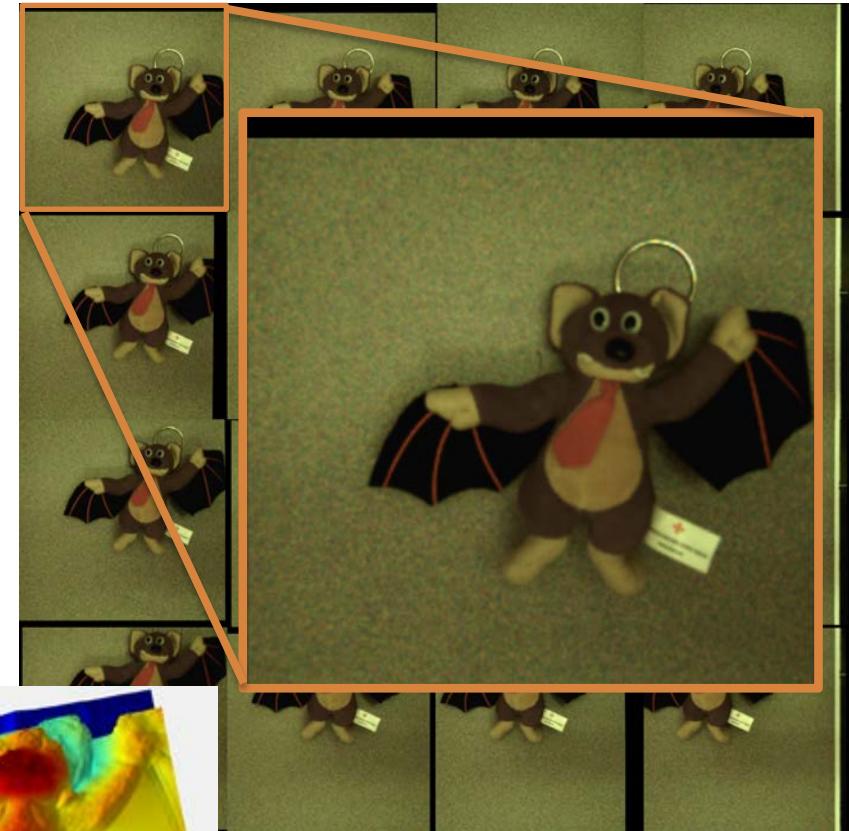

After optimization, the **average reprojection error** across all images is 0.3508 ± 0.2592 pixels.

Summary

AIT Calibration Toolbox

- turns any multi-view camera array into a **light field camera**.
- has been realized in **Matlab**, only dependencies to free libraries.
- uses non-linear **optimization** to minimize **reprojection error**.
- allows for an **exact depth measurement** for a multiview image through epipolar images rectification.
